SUBWAYARCHITECTURE/ JANSSENS-MOUFFE

Description

Very concerned by environmental issues, the workshop SUBWAY ARCHITECTURE applies its principles of eco-construction in various areas of activity: family dwellings, industrial buildings, commercial and sport surfaces, social housing, interior architecture, furniture and objects. If our design will logically in the direction of the ecoconstruction, it also wants to be minimalist, pure in its design. We tailor this line of conduct to each project and to its specific context, which brings each of our missions to a single result and custom. By the force of things, we have produced a lot of extensions and transformations. We are even able to adapt to any existing architecture - this is a constraint interesting - but we are not attached to a particular type. The inspiration, we can find in the language and the evolution of universe varied as the graphics, the paint or even the music. It really does not matter in the origin of this inspiration multiple. We are before any doors by the envy to make connections. Hence the name "Subway" that we have chosen to mention which also illustrates our web site. In the image of a subway which connected the places and people, we'll connect between them of materials, construction techniques, ideas and expressions that produce the meaning. Our inspiration is the result of these connections.
